About

The United Nations aims to end hunger and malnutrition by 2030. However, there are several challenges that will prevent it from achieving goals, for instance, epidemics, conflicts, inclement weather, and economic slowdown. As the world's population continues to rise and is expected to reach 9.7 billion by 2050, it can further cause vulnerability of global food security.

Building a sustainable food system is therefore an urgent matter. Vivaswan Agro Pharma as an integrated agro-industrial and food business, thus, applies sciences, innovations and technologies to produce quality and safe foods that are chemical free and contain sufficient nutrients for all ages with accessible prices, all of which contribute to increasing income of the farmers and ensure sustainable food security.

Floating Feed

Floating pellets have moderate protein and fat contents for feeding warm- water species such as tilapia, catfish, eels, etc.

Floating pellets are more expensive to buy and more expensive for feed millers to manufacture .

Sinking Feed

Sinking pellets are sometimes used in water when the fish do not regularly surface and also by pelleting some feeds it can be avoided to harm some ingredients which do not like extrusion process. It is known as a hard pellet.
